

Pair Assignment Guidelines

Cloning the Repository:

Both members of the pair should clone the repository. It should be cloned into your workspace folder. **Do not clone it into your named repository.** You can double check what directory you are on by using the pwd command:

```
Andy Chong Sam@DELL-JAVA MINGW64 ~/workspace  
$ pwd  
/c/Users/Andy Chong Sam/workspace
```

Pulling and Pushing:

Unlike your regular assignments, we want to pull and push as follows:

```
git pull origin master  
git push origin master
```

Pair Programming Process:

Suppose that the pair consists of Bob and Jill.

Bob will be typing code while Jill will be observing Bob - providing direction, feedback, and asking questions. After thirty minutes, Bob will add/commit/push his work. Jill will pull afterwards.

Now the roles are reversed - Jill will be coding while Bob will be observing and providing feedback. Again after thirty minutes, Jill will add/commit/push her work, and Bob will pull the latest.

You will do this until you are done. **Do not split up the work and code independently.** We must see evidence that both developers have committed.
